REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

Regarding independent **claims 1**:

Regarding **claim 1**, the Applicant claims a method of operating a service control point, the method comprising:

- receiving a call set-up message into the service control point for an incoming call;
- processing the call set-up message to identify a first device where the first device is a wireless device;
- generating an alert message indicating the incoming call and caller information from the call set-up message;
- transmitting the alert message from the service control point to the first device;
- receiving a response message into the service control point from the first device wherein the response message indicates a second device to receive the incoming call;
- processing the response message to generate a routing instruction that connects the incoming call to the second device; and
- transmitting the routing instruction from the service control point.

Regarding **claim 8**, the Applicant further claims a computer-readable medium having encoded thereon instructions that, when executed by a processor, direct the processor to:

- receive a call set-up message for an incoming call,

Art Unit: 2617

- process the call set-up message to identify a first device where the first device is a wireless device,
- generate an alert message indicating the incoming call and caller information from the call set-up message,
- transmit the alert message to the first device,
- receive a response message from the first device wherein the response message indicates a second device to receive the incoming call,
- process the response message to generate a routing instruction that connects the incoming call to the second device, and
- transmit the routing instruction.

Regarding **claim 15**, the Applicant further claims a communication system comprising:
a service control point (SCP) comprising:

- a processor configured to receive a call set-up message for an incoming call,
- process the call set-up message to identify a first device where the first device is a wireless device,
- generate an alert message indicating the incoming call and caller information from the call set-up message,
- transmit the alert message to an SCP interface, receive a response message from the first device wherein the response message indicates a second device to receive the incoming call,

Art Unit: 2617

- process the response message to generate a routing instruction that connects the incoming call to the second device, and
- transmit the routing instruction; and
- the SCP interface connected to the processor and configured to transfer the call set-up message to the processor, transfer the alert message from the processor to the first device, and
- transfer the routing instruction from the processor.

The closest prior art relevant to the claimed invention:

Connolly et al. - U.S. Patent Number 5,325,419

Connolly et al. discloses a system containing a call forwarding service that automatically redirects an incoming call to a second device when the first device fails to answer. The system contains an ISDN interface which allows for direct interconnection and switching of wireless and signaling traffic through the switched network. The network contains a SCP which first determines if the user has subscribed to the call forwarding service on the no answer condition. The SCP checks the user profile to determine if the user has subscribed to the service and if so, send a forwards call message to the PSC2, whereby the forwarded call message contains the called party ID whereby the call is forwarded. Connolly et al. teaches that the call forwarding is triggered in the network and not at the mobile device.

Although Connolly et al. is considered to constitute to the state of the claimed invention; however, in contrast with comparable differences, the instant Application is

Art Unit: 2617

considered novel over cited prior art because the Applicant discloses a system whereby an incoming call to a first device (wireless) can be directed to a second wireless device by a selecting the destination device in the first device and transmitting the instruction to a service control point (SCP). The novel point that the Applicant further claims is that the first device is able to direct the call to a second wireless device via a response message sent to the SCP which in turn directs the call to the second device. The user is notified of the incoming call and then the **"user"** is able to select a destination communication device in a pool of communication devices to receive the incoming call. In contrast to the cited references, the control of where to send the call "after" being received in the first device is being performed at the first device and not the network.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
